EXPERIENCE

Software Developer (Promoted from Intern)

Inspire Holdings Incorporated - Taguig City, Philippines Feb 2026 - Present

- **Rapid Career Progression:** Transitioned from a Software Developer Intern to a full-time role within 3 months, quickly adapting from a C#/ASP.NET Core background to a modern TypeScript backend stack
- **Backend Architecture & Engineering:** Designed and developed modular backend features using TypeScript, NestJS, Prisma ORM, and Supabase. Applied Clean Architecture principles, layered architecture, and separation of concerns to support modular backend development.
- **Modern Development Integration:** Rapidly implemented, analyzed, debugged, and integrated backend features into existing production systems while adapting to evolving business requirements.
- **Real-Time Features:** Supported and optimized real-time communication infrastructure utilizing Redis and Socket.IO, improving backend flow control and implementing lightweight ticket-based access validation.
- **Database & System Maintainability:** Enhanced database scalability and team collaboration by restructuring schemas, focusing on relational modeling, and executing clean migration practices.
- **Debugging & Optimization:** Analyzed system behavior, isolated complex meeting logic, and debugged critical backend issues to improve client-facing applications.

PROJECT WORK

CSBank – Enterprise Banking Backend | Personal Project

C#, ASP.NET Core Web API, PostgreSQL, Clean Architecture

- Designed a Clean Architecture solution encompassing Domain, Application, Infrastructure, and API layers to ensure separation of concerns.
- Modeled a relational banking database in PostgreSQL using normalized schemas, foreign keys, constraints, and transactional workflows.
- Implemented repository abstractions, Dependency Injection, and manual DTO mapping to separate business logic from persistence concerns.
- Designed customer registration workflows spanning multiple related entities with transactional boundaries to ensure data consistency.
- Built the project by learning SQL and relational database fundamentals before adopting higher-level persistence frameworks, developing a strong understanding of the abstractions they provide.

GAS (Guided-Adaptive Smoothing) Forecasting System | Asp.NET Core WebApi

2024 - 2025

- Designed and implemented a hybrid forecasting system combining SES and Holt-Winters using a moving window approach.
- Manually implemented forecasting logic in C# to deeply understand model assumptions and behavior without relying on external abstractions.
- Computed multiple error metrics per window to adaptively select the best-performing model.
- Structured forecasting logic into discrete backend services for clarity, maintainability, and correctness, focusing heavily on the performance and explainability of forecasting results.

RELEVANT STRENGTHS

- **Backend Engineering:** Clean Architecture, ASP.NET Core Web API, REST APIs, Dependency Injection, Repository Abstractions, DTO Mapping.
- **Database Engineering:** PostgreSQL, SQL, Relational Database and Query Design, Transactions, Constraints, Indexing, Query Design
- **Software Engineering:** Separation of Concerns, Layered Architecture, API Contract, Domain-Oriented Design.
- **Systems Thinking:** Strong interest and technical capability in backend systems, internal tools, real-time features, and high-performance applications.

EDUCATION

Bachelor of Science in Computer Science - Cum Laude

2022 - 2026

Major in Data Mining

Isabela State University Main Campus
